

Crypto Analysis Project

This project downloads Bitcoin and Ethereum historical price data using **Python (yfinance)**, stores it in a **data folder**, cleans it later, and then you can use it for **Power BI visualizations**.

Project Structure

```
Minor Project1/
|
├─ crypto_analysis.py      # Python script to download data
├─ data/                  # Folder where CSV files will be saved
└─ cleaned/               # For cleaned data (future steps)
```

Requirements

Install required Python packages:

```
pip install yfinance pandas
```

Python Script (crypto_analysis.py)

This script downloads Bitcoin and Ethereum daily price data from **2020-01-01** to today.

```
import yfinance as yf
import pandas as pd

# Download Bitcoin Data
btc = yf.download("BTC-USD", start="2020-01-01")

# Download Ethereum Data
eath = yf.download("ETH-USD", start="2020-01-01")

# Save inside data folder
btc.to_csv("data/BTC-USD.csv")
eath.to_csv("data/ETH-USD.csv")
```

```
print("Dataset downloaded")
```

Steps to Run the Project

Step 1: Create Folder Structure

Make sure these folders exist:

```
Minor Project1/  
  data/  
  cleaned/
```

If **data** folder does not exist, create it manually.

Step 2: Run the Script

Open VS Code terminal inside project folder:

```
python crypto_analysis.py
```

If successful, you will see:

```
Dataset downloaded
```

And inside **data/** folder, you will get:

```
BTC-USD.csv  
ETH-USD.csv
```

Next Steps (Power BI)

1. Open **Power BI Desktop**
2. Click **Get Data** → **Text/CSV**
3. Select:
4. `data/BTC-USD.csv`
5. `data/ETH-USD.csv`
6. Load both datasets

7. Create visuals like:
 8. Price line charts
 9. Volume charts
 10. BTC vs ETH comparison
-

Notes

- Keep internet on while downloading data
 - If you change folder names, update the script paths
 - CSV files will update every time you run the script
-
